

Introduction to organic chemistry.

IOC

Topics included:

- (1) Nomenclature
- (2) GOC-I (Electronic displacement effects)
- (3) GOC- II (Stability of intermediates)
- (3) GOC-III (Acidity & Basicity)
- (4) Isomerism

(3) Heat of hydrogenation (ΔH_H) \rightarrow It is the amount of heat released in hydrogenation of 1 mole of alkene.

$$\Delta H_H \Rightarrow b > c > d > a$$

$$\Delta H_H (\text{per mol } \pi \text{ bond}) \Rightarrow a = b > c > d$$

Rules to predict $\Delta H_H \rightarrow$

(i) $\Delta H_H \propto \text{No. of } \pi\text{-bonds}$

(ii) If π bonds are same, $\Delta H_H \propto \frac{1}{\text{stab. of alkene}}$

Q. order of HOH ?

* Double bond in 3-membered ring creates Unstability due to strain.

(g) $\pi-\pi$ repulsion
 $C=C=C-C-C$ (a)
 Cumulated

(c) Conjugated

$C=C-C-C=C$ (b)
 Isolated

Stab. $\Rightarrow C > b > a$

H₀H $\Rightarrow a > b > C$

(h)

stab. $\Rightarrow d > c > b > a$

H₀H $\Rightarrow a > b > c > d$

(4) To Predict Bond order / Bond length / B.E. \rightarrow

(i)

B.O. $\Rightarrow a > b$

B.E. $\Rightarrow a > b$

B.L. $\Rightarrow b > a$

(ii)

B.O. $\Rightarrow Y > X > Z$

B.E. $\Rightarrow Y > X > Z$

B.L. $\Rightarrow Z > X > Y$

Electromeric effect \rightarrow It is temporary effect but more powerful than inductive effect.

* It involves transfer of πe^- s by the demand of attacking reagent towards more E.N species.

* It is shown by comp. having >C=C< , >C=O , $\text{—C}\equiv\text{N}$ etc.

Two types \rightarrow

Attack of attacking reagent to the atom where πe^- s are transferred

Attack of attacking reagent to the atom from where πe^- s are transferred.

Bond cleavage/Bond breaking

Homolysis

Heterolysis

Conditions \rightarrow (i) $\Delta E.N. \approx 0$

(ii) Non polar medium or solvent
(CCl_4 , CS_2 etc.)

(iii) Vapour Phase should be Present

(iv) Presence of HELPR

H = Heat $\geq 50^\circ\text{C}$

E = Electricity

L = Light / U.V. / $h\nu$

P = Peroxide

R = Radical

(i) $\Delta E.N. = \text{large}$

(ii) Polar solvent
(H_2O , alcohol)
etc

Types of Rx^{\cdot} Intermediates \rightarrow

Name — Carbfree radical

Carbocation
or
Carbonium ion

Carbanion
or
Carbanium ion

Valence e^- — 7

6

8

Nature — Paramagnetic

Dia.

Dia.

Lewis acid
or —
Lewis base

X

L.A.

L.B.

Electrophile
or —
Nucleophile

E^{\oplus}

E^{\oplus}

Nu^{\ominus}

Hyb. —

sp^2

sp^2

sp^3

Shape — Trigonal
planar

Trigonal
Planar

Pyramidal

Applications of electronic displacement effects \rightarrow

stability of carbocations \rightarrow

\Rightarrow octet Incomplete

So It gets stable by completing its octet.

Carbocations stabilized by: $+M > \text{Reso} > \text{H.C.} > +I$
 $\text{Ar.} > \text{N.A.}$

Carbocations destabilized by: $-M > -I$

stab. of Intermediates \propto Rate of breaking of bonds

$$\propto \frac{1}{\text{Bond energy of bond responsible to form that intermediate}}$$

Q. Find order of stab. of following—

①

$9 \alpha\text{-H}$

$6 \alpha\text{-H}$

$3 \alpha\text{-H}$

$3 \alpha\text{-D}$

$a > b > c > d$

more
+M $\leftarrow a > b > c$ (stab. increases by completing octet so compare by +M)

Note → If m-groups and H.C. groups are present at o/p position to $-\overset{\oplus}{\text{C}}- / -\overset{\ominus}{\text{C}}- / -\dot{\text{C}}-$ then they affect their stability but if those groups are at meta position then they will not affect stab. of intermediates

(19)

$a > c > d > b \rightarrow \text{more } -I$

(20)

$d > b > a > c$

(21)

$\text{more } +I \leftarrow b > d > c > a$

(22)

$\text{more } +I \leftarrow d > c > b > a \rightarrow \text{less } +I$

(23)

$a > b > c$

(24)

$c > b > a$
↓ more +I ↓ less +I

Imp.
(25)

Dancing Resonance

$(b > a)$

**
(26)

stability of carbfree radicals \rightarrow

\Rightarrow octet Incomplete

So It gets stable by completing its octet.

Carbfree radical stabilized by: $+M \triangleright \text{Reso} \triangleright \text{H.C.} \triangleright +I$

$\swarrow \searrow$
 $\text{Ar}\cdot \triangleright \text{N}\cdot\text{A}\cdot$

Carbfree radical destabilized by: $-M \triangleright -I$

Q. write the order of stability ?

$$a > b > f > e > c > d$$

stab. of carbanions \rightarrow

 \Rightarrow octet complete, having LP so stabilize by donating its e^- . $\text{Ar.} > \text{NA}$

Stabilised by $\Rightarrow -M > \text{Reso} > -I$

destabilised by $\Rightarrow +M > \text{H.C.} > +I$
 \rightarrow If applicable

Q. write the order of stab. ?

$a > b > d > c$

(6)

5 eq. R.S.

 $a > b$

(7)

 $b > a > c > d$

(8)

 $c > a > b$

(9)

 $b > a > c > d$

(10)

-ve on bigger atom

 $a < b < c$ **
(11) $b > a$

$$a > b > c > d$$

$$a > b > d > c$$

$$b > d > c > a$$

$$c > a > b > d$$

(16)

$$a > c > d > b$$

(17)

$$b > a > d > c$$

(18)

$$a > b > c > d$$

(19)

$$a > b > c$$

(20)

$$a > c > b$$

(21)

$a > b$
↓
extended conjugation

(22)

$a > b$

(23)

$b > a$

(24)

$c > b > a$
